Temperature has most values concentrated in categories 31, 32, 33 and 35. Only a few observations made for categories 22, 24 and 37.

Rain has most values concentrated in categories 0, 0.1 and 0.3. There are quite a lot of observations with less frequencies.

Data Analysis

QQplot

```
qqnorm(forestfireregion1$Temperature, pch=2)  
qqline(forestfireregion1$Temperature, col ="green")
```

Normal Q-Q Plot

```
qqnorm(forestfirerregion1$Rain, pch=2)  
qqline(forestfirerregion1$Rain, col = "green")
```

Normal Q-Q Plot

```
qqnorm(forestfireregion1$RH, pch=2)  
qqline(forestfireregion1$RH, col = "green")
```

Normal Q-Q Plot

```
qqnorm(forestfireregion1$Ws, pch=2)  
qqline(forestfireregion1$Ws, col = "green")
```

qqplot gives us the idea about the distribution of data. In the above graphs it can be seen that Temperature, Rain, RH and Ws are having data, approximately normally distributed as most of the points lie on the qqline.

Hypothesis Testing:

Consider the hypothesis as given below,

$H_0: \sigma(\text{junemonthRain}) = \sigma(\text{julymonthRain})$ $H_1: \sigma(\text{junemonthRain}) \neq \sigma(\text{julymonthRain})$

```
junemonth=subset.data.frame(forestfirerregion1,forestfirerregion1$month==6)
summary(junemonth)

## F test to compare two variances
##
## data: julymonth$Rain and junemonth$Rain
## F = 0.025609, num df = 30, denom df = 29, p-value < 2.2e-16

## sample estimates:
## ratio of variances
## 0.02560914
```

The variances are not equal because the p value is much lesser than significance level and the fvalue doesn't lie between f1 and f2, hence we reject the hypothesis.

For unknown mean and unequal variances

Consider the hypothesis as given below, $H_0: \mu(\text{junemonth Rain}) = \mu(\text{julymonth Rain})$ $H_1: \mu(\text{junemonth Rain}) \neq \mu(\text{julymonth Rain})$

```
t.test(junemonth$Rain,julymonth$Rain,var.equal = FALSE,conf.level = 0.95)
```

```
##
## Welch Two Sample t-test
##
## data: junemonth$Rain and julymonth$Rain
## t = 1.3123, df = 30.437, p-value = 0.1992
## alternative hypothesis: true difference in means is not equal to 0
## 95 percent confidence interval:
## -0.3281092 1.5098296
## sample estimates:
## mean of x mean of y
## 0.8166667 0.2258065
```

We are using t.test because we have two means and the variance are unknown and are not equal. The p-value is greater than alpha i.e., 0.05. So we can accept the null hypothesis H_0 and agree that the increase of total rain in the month of June is equal to the increase of total rain in the month of July.

Hypothesis testing on one sample:

Consider the hypothesis as given below, $H_0: \mu(RH) = 68$ $H_1: \mu(RH) \neq 68$

```
fr<- forestfireregion1 %>% subset(Classes == "fire", select= RH)
nofr <- forestfireregion1 %>% subset(Classes == "not fire", select= RH)
t.test(nofr, mu = 68)
```

```

```

According to p value we should reject H_0 , when there is no fire average relative humidity would not be equal to 68.

Corelation

$r < 0.3$, weak correlation

$0.3 < r < 0.7$, moderate correlation

$r > 0.7$, high correlation
